Google photos search for duplicates

Device LinksChromebookMacWindowsDevice Missing?Google Photos is one of the more popular cloud options for storing pictures, even though each “new” image file now counts towards your limit. The cloud application includes 15GB of free storage, just like Google Drive (a separate cloud database), and the ability to back up all of your pictures automatically. Occasionally, though, you might find that you’ve got duplicate photos taking up your precious cloud storage space. So, what can you do to fix it, and why does it happen?The answer is that you cannot currently remove Google Photo duplicates using a batch process or third-party application. You can only remove duplicates in Google Photos cloud storage the manual way.Why post this article? It’s because many people are searching for a way to bulk-remove duplicates in Google Photos. They need to know that there is currently no way to remove them besides using a manual process.Now, with that bit of detail out of the way, keep reading if you’d like more information about why you get duplicate images in Google Photos (to help you control the issue), how to delete images in the cloud, and other bits of information about Google Photos.Why Do Pictures Get Duplicated on Google Photos?Google loves its AI and algorithms. It has a special one that detects every image’s unique hash code to ensure that exact, identical pictures don’t get uploaded twice. However, if you’ve made any changes to a photo, its hash code will change, and it will get uploaded again. Changes also include cropping, editing, adding stickers, corrupted or modified EXIF metadata, and sometimes, even accidental or corrupt device time zone changes during copy/paste functions. Once you’ve made any of the above changes to a photo or home movie, Google Photos will most likely treat it as an entirely new image.Another reason why duplicates happen is Google’s retirement of Picasa in 2016. Google Photos uploaded all Picasa images, which didn’t trigger the anti-duplication algorithm, meaning that you may have ended up with many duplicated pictures.How to Find Duplicate PhotosUnfortunately, there isn’t an automatic way to find duplicated images in Google Photos, so you will have to find them yourself. There used to be a few apps that could handle it for you, but since Google separated the Google Drive and Google Photos storages in July 2019, they now only work for Google Drive.Fortunately, Google Photos arranges the images by metadata, which generally makes it easier to find duplications. However, some exclusions apply! So, here’s how to find and remove Google Photos duplicates on PC, Mac, Android, and iOS.Delete Google Photo Duplicates on a PC or MacOpen up your web browser and go to google photos.Click on the “Photos” link in the left navigation menu—if not already selected.Scroll through your photos until you find a duplicate to delete. Tick the image, then repeat for any other desired copies.Click on the “Trash” icon in the top-right section and select “Move to Trash” to move all selected duplicates. Note that this will also remove the images on all devices and from their shared locations.Delete Google Photo Duplicates on a Mobile DeviceOpen the Google Photos app from your phone’s home screen or app menu.Tap on “Photos” at the bottom left of the screen if not already selected.Browse for duplicates and tick them as desired.Tap on the “Trash” icon at the top right of the screen. Confirm moving selected files to the trash.The above method will remove selected images from your Google Photos storage, placing them in the trash. Photos that got moved to the trash will stay there for 60 days, so if you make a mistake and delete the wrong image, you can quickly restore it within that time frame.In closing, it’s not as easy as it used to be to get rid of duplicate Google Photo images. However, Google has implemented its detection algorithm to ensure that identical photos or videos don’t get uploaded twice. Unfortunately, you may still find some duplicates due to glitches, manually copied files on another device, recovery attempts, edits, and other scenarios that can alter metadata. Since Picasa is dead, you have no more worries there unless you transfer old images into Google Photos. If you use any type of cloud storage, there’s usually a storage limit attached to each tier. The last thing you want wasting space is duplicates. To help you save money, make sure you download Gemini 2. The popular duplicate finder will scan your Mac or a sync cloud folder looking for duplicate files and helping you quickly get rid of them. Are you storing your pictures in the cloud? If not, you should be. It’s a great solution whether you want to back up your photos for safekeeping or you just need to free up space. Or maybe you just want to make sure you always have your pictures and videos with you. One of the most popular cloud-based photo services is Google Photos. Even though it’s one of the best available, it’s not without its downsides. While it tries to prevent you from uploading duplicate pictures, they still get through. And before you know it, duplicates can clutter your library on Google Photos. But, don’t worry. This article will help you find those duplicates in Google Photos and what you can do to remove them. Why are there duplicates in Google Photos? Every file has a unique hash code. It’s an identifier that helps distinguish it from other files. But from time to time, that hashcode changes when a file is moved across devices or if you edit the file. Edits can include things like cropping, adding stickers, or even the worst case if it gets corrupted in some small way. So, if you’re noticing a lot of duplicates in your Google Photo library, try to limit the number of devices you have syncing with your account. The flipside of cleaning up your duplicates is doing nothing about them and just living with them. But, you also need to think about how much space that’s wasting. And with Google Photos, you only get 15 GB for free. That means you’ll have to pay for any extra storage you use beyond that. How to remove duplicates in Google Photos manually The bad news is there’s no way to automatically batch delete the duplicates you have stored in Google Photos. And when I say, “manually delete” images from Google Photos, that’s exactly what it is. You’ll need to scroll through your entire library comparing pictures, looking for the duplicates, and deleting one at a time. The good news is that Google sorts your photos by the metadata associated with each file. So, in theory, your duplicate images should have the same timestamp and show up next to each other when you’re scrolling through. Follow these steps to learn how to eliminate duplicates in Google Photos manually. Open your browser and go to Photos.Google.comLog in with your Google account.Click Photos in the left sidebar.Scroll through and look for duplicate images.When you find a duplicate, click the check on the copy you want to delete.Then, click the Trash can icon. While there’s no automatic way to remove duplicates from Google Photos, the good news is that when you follow the steps above, it removes them on all of your devices. Automatic way to remove Google Photos duplicates Now, I know earlier you read that there’s no automatic way to find duplicates in Google Photos. But, if you’re using Google’s Backup and Sync app to store your files locally, you can use Gemini 2 to help you out. When you download Gemini 2 on your Mac, it will scan the folders you select, looking for duplicate files and helping you quickly get rid of them. The best part is you can try out Gemini 2 for free. Here’s how it works: Download and install Gemini 2.Open it on your Mac.Click + > Pictures folder > Choose > Scan for Duplicates. When the scan is done, you can select either Review Results to choose which copies you want to delete or click Smart Cleanup to let Gemini 2 get rid of all the duplicates, saving the best version of each photo. And that’s all you have to do to clean up with Gemini 2. Even though Gemini 2 is only able to scan the pictures syncing with your Mac, it’s still cleaning up the duplicates across all of your devices. Because the next time your computer syncs with Google Photos again, it will remove all those images from the cloud too. All that to say, even if you’re not already syncing Google Photos with your Mac, it might be worth it to start just to make cleaning up your duplicates that much easier. Duplicate pictures may not cause any major issues, but they can still be a huge headache. They can also slow down your photo library, and that’s not to mention the storage space they can waste. When it comes to cloud-based services, like Google Photos, that can end up costing you more money in the long run. That’s why it’s always a good idea to try and stay on top of it, keeping your library clean. Hopefully, this article has helped show you how to do just that. And if you end up using Gemini 2, that makes it that much easier to scan your Pictures folder regularly.
